

The RFID- batch is used to access extended functions for exposed pedestrians.

These functions are used by the school teacher with a whole class crossing the street, elderly people and the pedestrians with defective vision.

Using a RFID- batch you are able to control whom will be using the extended functions – go ahead and think of the new possible scenarios *to make a safe crossing possible*.

Scenarios

RFID – activation can for example trigger,

*Extended green time,
A speech message
A specific sound
An external speaker*

RFID – request for specific features

The RFID- batch can activate different functions in the Prisma DAPS and TS push button software.

It can also send a signal to the traffic controller, then it's up to the controller to activate an extended function.

Security

RFID—access security

Customers can choose to use security access based on local requirements or standards. Typical scenarios are, country, city, service region or choose to let all Prisma RFID- tags have access.

We can also provide different access for pedestrian with defective vision compared to the school teacher.

Prisma Teknik AB has long experience of developing and manufacturing unique high quality products with advanced and reliable technology. Our three product areas are acoustic pedestrian signals, deflection indicators and push buttons.
